Interface Security Systems

Changing the Paradigm

In this post September 11th era security has become an all-encompassing mission that begins at the front door or parking lot gate and extends to every department and every employee within an organization.

To meet this challenge head-on, Interface Security and Greater Alarm offer a broad range of security services and solutions that provide a whole new level of function and capability.

We provide design and engineering as well as a vertically integrated sales, installation and support organization that can provide 24/7 monitoring and support of all customer systems. We provide bundled turnkey services and solutions that historically only system integrators, specialty providers of interactive video and remote access management, or traditional alarm companies have been able to provide independently; and by doing so we're changing the paradigm. More and more we're functioning as an Application Service Provider (ASP) offering a broad range of high-level next generation security services and solutions delivered in one seamless integrated platform that manages security, life safety and facility risks.

For example, we're able to administer and monitor a customer's access control, video surveillance, fire and critical alarm systems all

through our Secure Operations Center at one workstation, so all necessary information required to make a decision regarding a security situation is now available to one operator to act on intelligently...improving the level of services we provide and replacing the need for on-site guards. This not only minimizes the capital investment a customer must make in their internal security infrastructure, and reduces their on-going costs to secure their environment—it actually provides a whole new level of service and features that puts critical information in the hands of our customers and the responders... in real-time—as it's happening.

Recent developments with open systems connectivity and network security, combined with digital and wireless technologies have enabled Interface and Greater Alarm to offer its customers remote managed services like real-time video verification; video guard tours and remote entry management solutions.

Clearly, technology is the driving force. Networks and the Internet are integral to both the design and operation of remote managed solutions and it is fast becoming a necessity for most of our integrated video, intrusion and access solutions to run on the internet or corporate network.

Our ability to engineer “open architecture” solutions that enable emerg-

ing technologies and equipment to work together and provide unique cutting-edge solutions is setting us apart from the competition.

The Security World is Changing

Traditional security solutions and stand alone engineered systems are fast becoming less effective in light of post 9/11 threats and the enhanced measures businesses are demanding from their facility management and security/loss prevention managers. This is especially the case with remote managed solutions that expand the reach and benefits to almost every department in an organization; and provide dramatically reduced costs and increased efficiencies. While most security companies focus on the “security aspect alone” our leading edge technologies and solutions also address the following:

- Personnel productivity issues
- Liability reduction
- Customer service issues
- Quality control
- Disgruntled employees
- Internal theft
- Human resources
- Production efficiency
- Safety-OSHA compliance
